# Pulsars as Precise Clocks: J1909-3744

On July 13, 2012 at 00:00:00 UTC:

$$P = 2.947108025429647 \pm 0.0000000000000002 \text{ ms}$$

# Pulsars as Precise Clocks: J1909-3744

On July 13, 2012 at 00:00:00 UTC:

$$P = 2.947108025429647 \pm 0.0000000000000002 \text{ ms}$$

The last digit changes by 1 every 713 seconds

# Pulsars as Precise Clocks: J1909-3744

On July 13, 2012 at 00:00:00 UTC:

$$P = 2.947108025429647 \pm 0.0000000000000002 \text{ ms}$$

The last digit changes by 1 every 713 seconds

This digit changes by 1 every 226 years

# Pulsars as Precise Clocks: J1909-3744

Last year I gave a seminar  
at Colgate starting on  
Sep 5, 2023 at 15:30:00 UTC.

Between that time and the start of this seminar,  
Sep 11, 2024 at 23:30 UTC, the pulsar has  
completed over 10,915650,076 rotations (0.65  
over!)

It's also completed almost 243 orbits around its  
companion white dwarf (0.19 to go!)

# More fun with J1909-3744

Smallest eccentricity of any known binary in the Universe:

$$e = 0.000000109 \pm 0.000000008$$

(in 2016 it was measured to be smaller formally,  
 $e = 0.000000092 \pm 0.000000013$ )

Orbit has radius= $(5.7014 \pm 0.0004) \cdot 10^8 \text{m}$  ( $0.82 R_{\text{sun}}$ )

But, we know the difference between the semi-major and semi-minor axis is  $3.4 \pm 0.5 \mu\text{m}$ !

# The Tiny Effects of GWs

$L \sim cT \sim 10$  lightyears ( $= 3$  pc  $= 10^{17}$  m)

$h \sim 10^{-16} - 10^{-14}$  (for our sources)

$\Delta L \sim hL \sim 10$ -1000 m  $\rightarrow \Delta t = \Delta L/c \sim hT \sim 30$ -3000 ns

0.001 – 0.1  $R_{NS}$
